WIRELESS.dev, Corp.

WIRELESS.dev, Corp. was organized in 1995 to act as the anchor entity for a core group of independent IT professionals, thus forming a virtual corporation for the purpose of bringing together established and talented software engineers, project managers and solution designers to build unique solutions. This concept allows WIRELESS.dev to easily plan and scale for projects in-progress and projects in the pipeline.

WIRELESS employs highly skilled, senior, local resources that bring a wealth of technical and industry specific expertise (clearing, trading, execution) to a project. Because of these resident assets, new clients will find WIRELESS to be an instant partner, instead of a vendor that will need to learn and understand the client's culture, language, and anticipated outcomes.

Since 1995 WIRELESS has designed and built numerous custom solutions for industries ranging from wireless telecom, financial services, and trading, to small business solutions providing customer relationship management, workflow management, and remote office applications. From 1995 to 1996 WIRELESS designed, built, and managed SBC's (Ameritech) wireless data lab. WIRELESS provided custom solutions to demonstrate SBC's Cellular Digital Packet Data, Circuit Switched Cellular, and Paging networks. From 1997 to 2001 Jim Geldermann worked on a new technical architecture for CNA Surety, designed GFI Group's next generation ECN, and defined and designed AG Edwards Order Entry and Trading System Upgrade. WIRELESS designed and developed a wireless handheld for futures floor brokers deck management and execution, a wireless handheld for distribution of proprietary market information, an exchange market data distribution system, and interfaces and custom trading tools for electronic exchanges.
